The general effect of piston friction on engine performance was examined during cold starting and normal working conditions. Key benefits include: — compatible with existing and advanced cylinder bore finishes and can be introduced seamlessly in volume engine production as a running change — composition provides greater thickness than pistons with conventional coatings, providing additional protection — fulfils stringent environmental standards; contains no toxic solvents — proprietary, advanced piston skirt coating with solid lubricants and carbon fibers reinforcement, especially designed for challenging gasoline applications — 10 % friction reduction in Power Cylinder Unit piston+rings vs. Such engines are referred to a rich burn engines.

Spark ignition gas engines achieve around 42% efficiency at best. After the piston crown comes to ring belt also called ring zone 3. The thermal load from the gas temperatures in the combustion process is also a cyclical load on the piston.

Piston

Internal combustion engines are further classified in two ways: either a , where the spark plug initiates the combustion; or a , where the air within the cylinder is compressed, , so that the heated air ignites fuel that is injected or. Gasoline engines with direct injection DI have special heads in order to direct the fuel stream in a tumble motion. This work develops a piston pin lubrication model capable of simulating the interaction between the pin, the piston, and the connecting rod.

However, newer configurations and the ability to use alternative fuels have revived interest, especially for range-extender applications where constant speed operation and low noise due to the continuous external combustion are beneficial. .

When used on piston rings, it case hardens the entire surface of the ring to a depth of about.

Engine builders must consider the type of material, the manufacturing process whether forged, cast or billet, the ring pack, including coatings, cost, and so on. The earliest hand-operated cranks appeared in during the 202 BC—220 AD.
