Room illumination, slit lamp light entering the pupil, too much pressure exerted on the examination lens or, in the case of a lens requiring coupling solution, suction on the cornea accompanied by pressure away from the cornea all can change the appearance of the angle. Robert Shaffer, MD, created a classification system of the angle's width.

Under normal circumstances, the angle cannot be seen on exam

Techniques of Slit

If the angle is not capable of closure, anticholinergic drops can be given to deepen the central chamber and improve the view. If the drainage system is not working properly, the pressure inside the eye, also known as intraocular pressure, can increase. Each of these parts comprises several subcomponents Figure 1 : Figure 1 Slit Lamp Anatomy A.
