## Infant Mortality in the 20th Century, Dramatic but Uneven Progress

Infant mortality, by race, 1915—1997, USA One problem in studying race and ethnicity as a factor in mortality has been inconsistency in reporting a child's classification on the death and birth certificates. This accounts for 40—60% of infant mortality in developing countries. Another seemingly paradoxical finding, is that when countries with poor medical services introduce new medical centers and services, instead of declining, the reported IMRs often increase for a time.

## Achievements in Public Health, 1900

The percentage decline in postneonatal age 28-364 days mortality 66% was greater than the decline in neonatal age 0-27 days mortality 40%. SIDS, although quantitatively half of what it was two decades ago, is still at 10% of all causes for both Caucasians and African-Americans; it is less prominent among Hispanics.

## The Impact of Federal Aid on the Quality of Life: The Case of Infant Health on JSTOR

Mortality rate ratios and 95% confidence intervals CI were calculated. Significant racial and socio-economic differences in the United States affect the IMR, in contrast with other developed countries, which have more homogeneous populations. Up until World War II and the dawn of the chemotherapy era, this decline appears more closely related to improvement in the biologic environment, particularly less crowded housing and the quality and quantity of water available to households for drinking, personal hygiene and sewage disposal.

## Achievements in Public Health, 1900

Funding for the federally subsidized Medicaid and Maternal and Infant Care was sharply reduced, and availability of prenatal care greatly decreased for low-income parents. For example, the inaccessibility of clean water exacerbates poor sanitation conditions.
