

# Risk management alternatives for the European feedingstuffs industry

Wissenschaftsverlag Vauk - Risk management and supervision of insurance companies (Solvency 2)

Process Equipment	Advantages	Disadvantages	Comments
Short term conditioners (single/multi-point steam injection), used singly or in combination	Can feed other conditioners. On their own retention times are short.	Restricted areas for steam feed contact.	Generally used to raise feed temperature quickly before passing to a retention vessel.
Long term conditioners	Time/temperature can be varied. Can be used to provide a lower energy heat treatment to protect heat sensitive feed constituents.		Must be first-in, first-out (FIFO) basis.
Double conditioning/pelleting	Variable process conditions can be accommodated, tend to be short retention times.	Heat penetration tends to be variable. On their own are not likely to fully kill <i>Salmonella</i> .	
Aerobic pasteurizer	Time/temperature can be variable. Direct heating of raw materials.	Can be difficult to regulate product flow.	
Expanders/extruder technology	Retention times very short.	Temperature sensors tend to measure process plant causing temperature rather than feed temperature.	High temperature produces thermal shock to microbes.

## Risk management and supervision of insurance companies (Solvency 2)

There are clear cases where the use of a substance is exempt from the need for REACH Authorisation, for example if the substance is present in a mixture at a concentration below 0.

### REACH Authorisation Services

In a more complex case, in-depth semi-quantitative analysis may be needed. Destinations and operators that have prepared well and implemented the best strategies to manage the crisis will be best positioned to survive the crisis and welcome visitors again as quickly as possible. In case the applicant has identified a valid alternative but it is not available before the sunset date, the applicant needs to apply for authorisation.

### How to manage risks in tourism?

A CSR that has been prepared correctly for an Authorisation application reduces the uncertainty in the eyes of the authorities and strengthens the case for a positive decision on Authorisation. Issues, however, arose with this Authorisation application strategy; it became clear quite early in the life of the process that such applications, unless very specifically defined, would fall foul of uncertainties in the mind of the authorities. Preparing for risk or crisis situations is commonly referred to as a Risk Management Process.

### How to manage risks in tourism?

A Registration CSR is used by a SIEF to cover all the intended uses of the supply chain. If you submit your application after the latest application date, you are not eligible for the transitional arrangements and you need to stop using the substance after the sunset date. This allows companies, who are currently engaged in lobbying for an exemption, to select a phased project approach.

**Risk management alternatives for the European feedingstuffs industry (Book, 1987) [perssongroup.materialsproject.org]**

Human health and environmental impacts: These impacts cover all possible effects directly related to the toxic, eco-toxic or physiochemical properties of the substance. We would be very glad to help you! Remember that your teams are also hurting during the crisis, and once recovery starts, you will need strong, motivated teams to move the business forward.
