

Geochemical reconnaissance using heavy minerals from small streams in central South Carolina

U.S. Dept. of the Interior, Geological Survey : for sale by the Supt. of Docs., U.S. Govt. Print. Off. - Statistical map analysis techniques applied to regional distribution of uranium in stream sediment samples from the southeastern United States for the National Uranium Resource Evaluation Program

Description: Areas favorable for prospecting the Carolina state belt evaluated by spectrographic analyses and cluster analyses.

USGS MF Maps 5

In addition to these on-site effects, soil erosion degrades waterways as suspended sediments reduce the physical, biological and chemical water quality of streams ., Last Updated: Sep 14, 2017 Work History Year Work Type Comment 2016 Drilling: Diamond One hole, 113.

Donna

Consequently, the range test analyses the conservative behaviour of the selected tracers. This led to the hypothesis that unpaved tracks and gullies are the main sediment sources in smallholder agriculture catchments of the highlands of Kenya.

USGS MF Maps 5

Geochemical data for soils collected by USGS personnel and analyzed by the USGS. For this analysis, a sub-sample of 500 mg was placed onto a thin film to measure trace elements at a setting of 40 kV and 15.

USGS: Mineral Resources On

Data on a variety of mineral deposit types that have variable environmental effects when exposed at the ground surface by mining or natural processes. The occurrence lies west of the Big Salmon Fault which separates Neoproterozoic to Devonian? Analyses of 72 water samples include pH, conductivity, water temperature, major cation and anion concentrations, trace-element concentrations, and dissolved organic-carbon concentrations. A stratified sampling design was used which was based on field reconnaissance and Google earth imagery.

[PDF] Geochemical prospecting using water from small streams in central South Carolina

Field-scale investigation of the effect of land use on sediment yield and runoff using runoff plot data and models in the Mara River basin, Kenya. Examples are taken from Indonesia and Sri Lanka.

Geochemical exploration for uranium and other metals in tropical and subtropical environments using heavy mineral concentrates

From 1999 to 2001, Jones, one of the owners of the property, carried out bio-geochemical surveys. The selected tracers showed clear differences in their concentrations between sources, caused by underlying biogeochemical and pedological processes related to each element.

Stream sediment geochemistry of the upper Cheyenne River watershed within the abandoned uranium mining region of the southern Black Hills, South Dakota, USA

Gold and silver grades were lower in the drill program than observed in the trenches, likely due to poor recovery methods.

Geochemical exploration for uranium and other metals in tropical and subtropical environments using heavy mineral concentrates

In 2011, a 13 hole, 1,633 m drill program intersected gold and silver mineralization across several metres within carbonate-rich skarn and altered diorite. Water quality data for the area include pH, dissolved oxygen, alkalinity, total acid soluble and dissolved major and trace element concentrations for sites around the mine workings. Maps are provided in PDF only.
