Air Compressors For Mining

If you combine that with any leaks in your mining operation, the costs could rise substantially, which is why system efficiency is so important in reducing your overall expenditures. It is a clean source of air and can be used effectively without the need for additional cleaning materials. When the capacity of an existing chilled water reticulation system is maximized, underground refrigeration systems can be used to provide additional cooling.

Air Compressors For Mining

Learn about how Howden's knowledge is key to energy-saving and increased production on mining sites. It is important that piping is adaptable to the different variations at the mine. Modern mining processes rely on enhancements in safety equipment, as well as consideration for reducing negative impacts on the environment.

Reciprocating/Piston Air Compressors

Large volumes of air became essential for working in spaces that stretched miles beneath the surface. Selecting the right compressor to meet your needs can help increase productivity and serve to lower energy costs.

Reciprocating/Piston Air Compressors

Once a mine reaches a depth of 800m or 1000m, productivity and working conditions inside the mine become increasingly difficult due to the increase in temperature. They are used where high compression ratios are required per stage without high flow rates. This is when it's crucial to have an engineering study of the best possible refrigeration solutions tailored to each mining site.
