Calcium compartmentalization in pancreatic acinar cells

Organic and inorganic calcium antagonists reduce vasoconstriction in vivo mediated by postsynaptic α 2

Filesize: 25.28 MB

In low doses a parallel displacement to the right was observed, whereas in higher amounts the shift was non-parallel. It is concluded that an influx of extracellular Ca^{2+} is necessary for the vasoconstriction in vivo initiated by stimulation of vascular postsynaptic α 2-adrenoceptors.

Calcium movements related to neurohypophyseal hormone secretion

The method has been used to determine both diltiazem and its desacetyl derivative in plasma obtained from healthy volunteers after oral doses of 60—210 mg of diltiazem. La^{3+} and Mg^{2+} were ineffective.

Kinetics and energy

The divalent cations Mn^{2+} , Ni^{2+} and Co^{2+} .

The calcium antagonists verapamil, D 600 and nifedipine, when given intraarterially i. The measured transport numbers attest a high selectivity in ion permeation.
