## Three

Adjustment occurred on the Frankfurt horizontal line, parallel to the floor. In the future, an improved and individualized approach to acute pain management may be possible if we can determine a patient's pain threshold before the operation. Abstract Backgrounds and objective: Some studies have shown that deeper anesthesia is more effective on postoperative analgesia and reduces the need for sedative drugs.

## Factors associated with rebound pain after peripheral nerve block for ambulatory surgery

Data were determined from a retrospective database study of 313 patients who were readmitted to the hospital with complications related to surgery within a 30-day period after discharge from same-day surgery. Interim analysis was planned following every 100 pain cessation events with a partitioned  $\alpha$  level to maintain the overall study  $\alpha$  at. J Urmia Univ Med Sci.

## Transcutaneous Electric Nerve Stimulation Reduces Acute Postoperative Pain and Analgesic Use After Open Inguinal Hernia Surgery: A Randomized, Double

Due to the risk of gastrointestinal bleeding, NSAIDs might not always be the best choice depending on patient risk factors. Our findings mirror the opioid-sparing effects of gabapentin reported in other settings, as coadministration of gabapentin reduces opioid requirements. Stratification controlled for the different degrees of tissue healing associated with each type of surgery and the associated multimodal analgesia protocols of specific operations eg. total hip or knee replacement.

## Postoperative pain after the application of two different irrigation devices in a prospective randomized clinical trial

In all cases, plating was attempted along frontozygomatic suture, infraorbital margin and zygomatico maxillary buttress Figure.
