The technology for these balloons is now maturing rapidly and we are now looking forward to the prospects for altitude control balloons that can cycle repeatedly through the Venus cloud region. Any responsibly formulated public space policy must weigh all of these factors before deciding whether or not an investment in human space activities is scientifically and socially desirable.

Armed with both detailed benchmarks to gauge expected performance and a detailed monetary cost analysis, we expect this paper will be a recipe cookbook for scientists to help them decide where to deploy and run their scientific applications between public clouds, private clouds, or hybrid clouds. At JPL, the focus for the last decade has been on the development of a 7m diameter superpressure pressure twice that of VeGa capable of carrying a 100 kg payload 14 times that of VeGA balloons , operating for more than 30 days 15 times the 2 day flight duration of the VeGa balloons and transmitting up to 20 Mbit of data 300 times that of VeGa balloons.

These applications are driven by an improved portable interface that can manage virtual clusters and run various applications in the cloud.

Here, we argue that development scientists often work in such a universe.

Thus distributed computing platforms associated with parallel computing are required for faster designs processes. The cloud retrieval simulator we have developed allows us to probe these important questions in a realistically relevant test bed.

However, most scientific data products are notoriously hard to use. Recently, a number of metaheuristics optimization schemes have been applied to address the challenges of applications scheduling in the cloud system, without much emphasis on the issue of secure global scheduling.
