As such, the equator has been numbered 0° with the latitudes divided into those that are north and south the equator. Most types of projection can be grouped according to their geometric derivations as cylindrical, conic, or azimuthal.

Map Projections

The National Ocean Service originally Survey maintains charts of U.

2(a). Introduction to Maps

Comments regarding certain features or areas, which the editor may deem helpful to the user, may be made in the map itself.

Map Projections

When drawn at an interval of 1° , there will be 89 circles of latitudes on either side of the equator. The Earth takes this form because causes the region near the equator to bulge outward to space. Scale Factor at Central Meridian is the ratio of map scale along the central meridian and the scale at a standard meridian, where scale distortion is zero.
