### le ministère des Ressources naturelles et du Développement de l'énergie du N.

It is noteworthy that the N-S structural trends like Boltaña or Mediano folds coincide with these thick Triassic areas. The sedimentary rocks of the Blue Ridge, Ridge and Valley, and Appalachian Plateaus Provinces yield small to moderate supplies of ground water.

### Maryland Geology

However, in the Asturian Basin, the Buntsandstein and Muschelkalk do not exist, making the Triassic difficult to differentiate from the Permian. In this sector Naour-Aghbala which corresponds to the presumed closure zone of this Aptian Atlantic marine trough, the sedimentary record reveals a strong dependence on the regional structural framework. On the other hand, towards the North, the Aptian layers rapidly change from marine to lagoonal then to continental facies.

### The Occurrence of the Complexiopollis

A broad valley floored by Precambrian gneiss and volcanic rock lies in the core of the anticline between the two ridges. F increases from less than 0. It is assumed that outside the forests, mardels may have been masked out by agricultural levelling Poeteray et al.

### Building Stones of Our Nation's Capital: Washington's Geologic Setting

. C Mardel after Roman clay excavation, filled with post-Roman clayey colluvium, burying the quarry floor.

### Building Stones of Our Nation's Capital: Washington's Geologic Setting

This is an addition to Fig.

### Building Stones of Our Nation's Capital: Washington's Geologic Setting

The development of mardels on the Steinmergelkeuper. The lithology of the Lower Permian Rotliegend is characterized by the presence of

conglomerate series and volcanic rocks at its base and contains relatively thick salt-rich layers in its upper part within the Glueckstadt Graben and adjacent areas. The role of Triassic evaporites and the spatial and temporal relationships between thrusting and salt tectonics are indicated.
