Moving block

Radio Block Centre A control centre to supervise and control train movements in a territory with radio-based train control.

MOVINGRAIL Deliverable 2.1

Sujay has good experience in Integrated Railway Design and Interface Management. This requires both knowledge of the exact location and speed of all trains at any given time, and continual communication between the central signalling system and the train's cab signalling system. Provide a roadmap for the introduction of Virtual Coupling considering potential business risks and possible migration issues.

Distance

ABS operation is designed to allow trains operating in the same direction to follow each other in a safe manner without risk of rear-end collision.

Beginners Guide: Railway Signalling till ATC

The timetable system has several disadvantages. It forms part of the 's level-3 specification for future installation in the , which will at level 3 feature moving blocks that allow trains to follow each other at exact braking distances. For example, where manual or automatic block was implemented, train orders would be used to authorize movements into occupied blocks, against the current of traffic or where no current of traffic was established.
