Comparing the efficiency of intensity

Both field and laboratory studies were based on quantitative observations taken on the density gradients of brood and attack counts, the spatial pattern of larvae and on the external characteristics of sample trees.

Glossary

This often results in a sharp disjunction between growth rings, as the next cell formed will be a large-diameter, thin-walled cell that marks initiation of the next year's earlywood. This was demonstrated by the research of Alexander 1935, Larson 1957, 105 Wakefield 1957, McKimney 1959, Risi and Zeller 1960, Keith 1961, Littleford 1961, Wellwood and Wilson 1965, Wilfong 1966, and Nylander 1967.

Comparing the efficiency of intensity

Selling stumpage by weight in the south: a case study.

How can you measure the volume of a tree?

The factors that are common to both are the short growing season, low temperatures, and high winds.

Interim Taper and Cubic

Rennie 1966 suggested a method for sampling biomass and pointed out that usually not less than 20 trees must be sampled for a reliable statistical correlation analysis. The interaction terms were positive in two locations and negative in one location. Many mixed hardwood stands in the South and Northeast and mixed conifer stands in the Rocky Mountains are the result of inappropriate high grade cutting; yet research has not studied the stand development patterns enough to determine many other ways to manipulate these stands.

Economic viability of longleaf pine management in the Southeastern United States

Round Knot A round knot is one which is oval or circular in form.
