## B.6 Brewer Gold Mine Case Study

Brewer is a high sulphidation system driven by a sub-volcanic intrusive and possibly connected to a large copper-gold porphyry system at depth, as indicated by: widely known prospective geology, including diatreme breccias; associated high sulphidation alteration; gold and copper mineralization; and geophysics Schmidt, R.

### Pancontinental Uranium Corp (PUCCF) Quote

The strong continuity of gold and associated mineralogy in these 44 shallow holes drilled outside the former mine to the northwest, west and south is significant, and very encouraging for our upcoming deeper core drill program. Brewer is a high sulphidation system driven by a sub-volcanic intrusive and possibly connected to a large copper-gold porphyry system at depth, as indicated by: widely known prospective geology, including diatreme breccias; associated high sulphidation alteration; gold and copper mineralization; and geophysics Schmidt, R.
