British Crop Protection Council - DDT, Fraud, and Tragedy

The DDT Story...

- In the 1960s we learned how pesticides can spread through the environment. The use of DDT was restricted in Canada after 1969.
- About ten years after the first use of DDT, signs of trouble appeared. Dead birds, fish, frogs and other animals were found in areas that had been sprayed with DDT. The fat in their bodies contained high levels of insecticide (DDT). Harmless or beneficial insects, such as butterflies and honeybees, also started to disappear from areas that had been sprayed.
