## Projecting future changes in distributions of pelagic fish species of Northeast Pacific shelf seas

The Zooplankton Study has estimated the abundance of zooplankton taxa since 1972 as a means of assessing trends in fish food resources from eastern San Pablo Bay through the eastern Sacramento-San Joaquin Delta and Suisun Marsh. We projected future range shifts of pelagic marine fishes of the Northeast Pacific shelf seas by 2050 relative to the present. The projected species range shifts result in a high rate of range expansion of this group of species into the Gulf of Alaska and the Bering Sea.

## Distributions and abundances of Pacific sardine (*Sardinops sagax*) and other pelagic fishes in the California Current Ecosystem during spring 2006, 2008, and 2010, estimated from acoustic

The abundances and distributions of coastal pelagic fish species in the California Current Ecosystem from San Diego to southern Vancouver Island, were estimated from combined acoustic and trawl surveys conducted in the spring of 2006, 2008, and 2010.

## California Nearshore Aerial Pelagic Species Survey

The uncertainties in these estimates are mostly the result of spatial patchiness which increased from sardine to mackerels to anchovy and herring. These science-grade echo sounders send a sound pulse through the water and measure the sound waves echoing back from fish; fish abundance can be mapped as the saildrone makes repeated measurements moving through the water. Staff of the Striped Bass Study calculate adult striped bass abundance, relative abundance, harvest rate, and survival rate by using data from Commercial Passenger Fishing Vessel Party Boats; CPFV , various creel surveys, and a mark-recapture program

## California Nearshore Aerial Pelagic Species Survey

Only a small portion of the population is harvestable during any particular time period. The San Francisco Bay Study Bay Study was established in 1980 to determine the effects of freshwater outflow on the abundance and distribution of fish and mobile crustaceans in the San Francisco Estuary, primarily downstream of the Sacramento-San Joaquin Delta.

## Fish Bulletin 162. Pelagic Fish Surveys In The California Current

We combined published data, expert knowledge, and pelagic fish survey data to predict current species distribution ranges of 28 fish species of the Northeast Pacific shelf seas that occur in the epipelagic zone and are well-represented in pelagic fish surveys. The cooperative research that combines NOAA Fisheries science and insight from fishermen provides long-term benefits for both. The sardine biomass was located mostly off.

## **Fish Bulletin 162. Pelagic Fish Surveys In The California Current**

Saildrone operations and data collection services are encrypted and secure. He said the fishing fleet benefits from high-quality data on fish populations that help ensure they are managed sustainably, providing continuing benefits to fishing communities and the marine ecosystem.

### **California Current Fish Surveys Resume with 3**

California Current Ecosystem Survey CCES The California Current Ecosystem Survey CCES was created from two previous surveys, SaKe Sardine and Hake Survey and the Coastwide Sardine Survey, which now encompasses all CPS in the Pacific Ocean from Canada to Mexico. The California Department of Fish and Game started routinely acoustically surveying the smaller schooling pelagic fish resources in the California Current System in 1966.
