## Coccolithophorids from the west coast of Baja California, Mexico, Hydrobiologia

Observations on surface distribution of marine plankton diatoms of Lower California in 1922. Phytoplankton blooms occurred in the Sea of Cortez shortly after irrigation along the coast carried fertilizers and other agricultural run-off into the sea. These small floating algae drift in the surface currents, and drifting organisms are called plankton.

## Phytoplankton Bloom in the Gulf of Mexico

Trois espèces du genre ont été retrouvées dans quelques échantillons recueillis dans l'océan Pacifique mexicain. Nous avons observé des matériaux vivants de ces trois espèces, mais nous n'avons pas pu reconnaître les spécimens dans les échantillons conservés.

## Coccolithophores

Here we provide morphological information obtained by light and scanning electron microscopy on D. The exception is the Serravalian deposits at the locality of Kalayçölar, western fan that provided higher numbers of tropical to temperate latitude nanno-fossils with increasing percentages from 30 to 50—55 % and decreasing numbers of temperate to high-latitude taxa 25—30 %.

## Exploring the Gulf of Mexico: Phytoplankton Part I

Symposium, Ankara 215—227 in Turkish. We describe five taxa of silicoflagellates: four species and one variety, including some morphological variants traditionally considered as recognized species or varieties.

## Coccolithophorids from the west coast of Baja California, Mexico

Self-archiving in repositories, personal webpages or similar, of any version other than the published by the Editor, is not allowed. The role of

pelagic crabs in the grazing of phytoplankton off Baja California. The cocolithophorid assemblages are considered subtropical and coastal with many cosmopolitan taxa.
