Studies on Characteristics, Applications and Strength Improvement of Marine Clay: A Review

The marine clay when mixed with cement, light weight aggregate from industrial slag can be used to reclaim the land and can be adequately strengthened to take up heavy duty applications. Marine clay has been extensively studied for assessing its properties, behavior when admixed with materials like lime, cement, coir, husk, granite tile, industrial waste slag, shredded rubber and chemical additives. Descontos ou vantagens não acumuláveis com outras promoções.

Effects of smectite, salinity and water content on sedimentation and self

The case studies reported as carried out in various places provide a better picture of the variations and complexities encountered and the methods adopted for converting in for useful applications. The consolidation studies are very vital and play an important role. The parameters analysed from the marine clay samples at different locations predominantly along the Indian coast are primarily for adopting a most suited method for specific purposes and are confined to a specific location such as port development.

International Symposium on Marine Natural Products

A Laboratory Study on Consolidation Characteristic of Marine Clay Treated with Fly Ash and Additives. The consolidation characteristics, determination of strength improvement strategies using admixtures at different proportions are frequently adopted. Laboratory Study for Soil Structure Effect on Marine Clay Response Subjected to Cyclic Loads.
