ASTM D412: Standard Test Methods for Vulcanized Rubber and Thermoplastic Elastomers

Procedure C is used to measure the adhesion of rubber to metal with a conical sample. The term originally referred exclusively to the treatment of with , which remains the most common practice. Compression Deflection ASTM D 575-91 Testing Standard Test Methods for Rubber Properties in Compression These test procedures outline the test methods for determining the compression-deflection characteristics of rubber compounds other than those usually classified as sponge rubber and hard rubber.

Elastomer Testing

RTV-2 is used to make flexible moulds, as well as many technical parts for industry and paramedical applications. Not all instruments and methods will accommodate the entire ranges. Most conventionally used accelerators are problematic when CR rubbers are cured and the most important has been found to be ETU , which, although being an excellent and proven accelerator for polychloroprene, has been classified as.

ASTM D412

ISO 37:2017 specifies a method for the determination of the tensile stress-strain properties of vulcanized and thermoplastic rubbers. This test routine can be used to evaluate rubber compounds on a laboratory comparison basis.

BS 903

The main polymers subjected to are natural rubber and rubber SBR , which are used for most street-vehicle tires. These test methods allow for the measurement of such tensile properties.

BS 903

During vulcanization, some of these C-H bonds are replaced by chains of sulfur atoms that link with a cure site of another polymer chain.
