Of course, the main point of this article isn't to explore mastodon appearance in detail, but to stress that the nature of their skin is nowhere near as well-evidenced or understood as we've historically implied. It's in this context that we have to view the 1839 Missouri mastodon reported to have extensive amounts of preserved skin, arteries and sinew, which was reported by non-other than : the same museum proprietor responsible for reconstructing *Basilosaurus* as a sea serpent and a Missouri mastodon as the 'Missourium' - a monstrous assemblage of mastodon and wooden blocks toured for public display in the mid-1800s.

Current research is focused on Zimbabwean prehistory and paleoenvironments.

The Differences Between Mammoths & Elephants

Eisley published rebuttals to this concept several times during the 1940s and, in his 1946 Science article Men, Mastodons, and Myth, he specifically delved into the peculiar history of mastodon soft-tissue discoveries.

Enjoy monthly insights into palaeoart, fossil animal biology and occasional reviews of palaeo media? The Channel Islands mammoth, for example, evolved on its namesake islands off California from ancestral Columbian mammoths, but stood only some 5-feet, 10-inches tall and may have weighed only 441 to 1,102 pounds. It was not only the first alleged mastodon hair, but also the first indication that some Pleistocene giants might have been covered in fur. *Mammoths, mastodonts, and elephants: biology, behavior and the fossil record*.

Mammoths, Mastodonts, and Elephants: Biology, Behavior and the Fossil Record by Gary Haynes

The distinct habitat preferences of mastodon and woolly mammoths are demonstrated by their remains being very rarely found in the same fossil horizons Graham 2001; Hodgson et al. Trunk tips differ among the elephantids, too.

Aside from the obvious fact that mammoths are extinct, a number of physical, ecological and geographic differences distinguish these behemoths. I work as a freelance author, consultant and artist: check out my work at , follow me on Twitter , and browse my books. I'm increasingly of the opinion that that, when considering the life appearance of gigantic, multi-tonne extinct animals, we should be justifying the presence of thick layers of insulation, not the removal of it, and I feel that approach has merit here.
