Color vision

Zygote scenes is a collection of scenes created by zygote media group with annotations identifying anatomical landmarks. This procedure yielded a spatial array of simulated voxel responses with different population receptive fields pRFs. Every day, we face a flow of varied.

Interactions between orientations in human vision

When we look at an object, an optical image is projected on the retina. Our results provide a framework for reinterpreting a wide-range of findings on orientation selectivity.

Interactions between orientations in human vision

In humans, standard anatomical position is defined as standing up straight with the body at rest. To fully characterize the contrast sensitivity function, the experiments would need to be repeated with gratings at various orientations.

Stimulus vignetting and orientation selectivity in human visual cortex

Nearby neurons respond to nearby locations in the visual field, and therefore will respond similarly to the vignette.
