Note on two upper Carboniferous Pteridosperms from Kentucky

Chadwick, R A, Holliday, D W, Holloway, S, and Hulbert, A G. The north of Scotland was located at about 20° south of the on the continent of near the , while the rest of the country was at about 60° south on the continent of near the. Based on the sedimentary context of this paleoflora, we assume that the Val Sanagra sediments were deposited in a continental setting, in a fluvial environment with a well-developed and vegetated floodplain where where clastic substrates would locally and occasionally change into peat swamp.

Record details

Full article: Carboniferous postglacial faunas in the late.

Note on two upper Carboniferous Pteridosperms from Kentucky

Lower Carboniferous biota of Glencarholm, Eskdale, Dumfriesshire. Recent work has also recorded ostracods and bivalves referable to a Famennian age.

Revision of the Pennsylvanian Flora from Val Sanagra in Western Part of the Southern Alps (Italy) in: Folia Musei rerum naturalium Bohemiae occidentalis. Geologica et Paleobiologica Volume 46 Issue 1

Formed from rock originally deposited at the surface of the planet, the rocks were later buried deep in the Earth's crust and into crystalline gneiss. A ginkgo leaf from the Jurassic; today the last species of these deciduous trees grows up to 30 metres tall and has similar pale green, fan-shaped leaves. These treeferns are rather extraordinary plants though see for example this Tempskyia sp.

Plants

Fossils of these very fragile plants are rare.

Early Carboniferous plants of the Arkhangelsk Region, Russia

Kidston and Lang discovered a new class of plants that do not produce flowers or seeds and three new genera. .
