## Burden, trends, and risk factors of esophageal cancer in China from 1990 to 2017: an up

The high incidence regions are mainly represented by Chinese and Japanese research. Global status report on noncommunicable diseases.

Gastro

Risk of gastroesophageal cancer among smokers and users of Scandinavian moist snuff. Another example is from the 1950s, when breast cancer excesses of 1.

## A world map of esophagus cancer research: a critical accounting

Stage IV cancers have metastasized, or spread, to distant organs such as the stomach, bone, or brain. Germany and the UK ranked 4th and 5th.

## **Chronic Esophagitis: A Possible Factor in the Production of Carcinoma of the Esophagus**

If the cancer is confined to the upper region of the esophagus, an esophagectomy may be done to remove the cancerous portion, along with nearby lymph nodes, and to reconnect the remaining esophagus to the stomach. Not being apparently healthy, this control group may differ from the general population, as they may have higher exposure rates for the risk factors of oesophageal carcinoma such as alcohol consumption, consumption of deep fried food and spicy food.

## **Chronic Esophagitis: A Possible Factor in the Production of Carcinoma of the Esophagus**

Large international differences in breast cancer rates and migrant studies suggest that diet is a likely environmental factor.

Gastro

Some epidemiological studies have found an increased risk of brain cancer associated with petrochemical workers, rubber and tire workers, electrical workers, health professionals, farmers, and workers with exposures to vinyl chloride and polychlorinated biphenyls. This might partly explain the higher burden of EC in men than in women. Bases and caustics are corrosive, which might alter the epithelial cells of the esophagus or lead to corrosive esophagitis.
