The Most Successful Air Pollution Treaty You've Never Heard Of

Many people are familiar with some of the most well-known POPs, such as PCBs, DDT, and dioxins. The acid rain control amendments are being hailed as a break with past environmental protection practice and are being offered as a model for further regulatory reform.

Persistent Organic Pollutants: A Global Issue, A Global Response

Prolonged transport of sulphur and nitrogen compounds allows time for the chemical and physical change of sulphur dioxide and nitrogen oxides into acidic compounds. Human-made sources are fossil fuel combustion, and the internal combustion engine of automobiles. Warming occurs when more heat is retained than what has escaped.

Introduction

Unintentionally Produced POPs The Convention calls upon Parties to take certain specified measures to reduce releases of unintentionally produced POPs with the goal of their continuing minimization and, where feasible, ultimate elimination.

Long

Many nations have adopted air quality standards to safeguard the public against the most common pollutants.

Reducing acid rain

Status aldrin and dieldrin Insecticides used on crops such as corn and cotton; also used for termite control. To this end the Nuclear Electric Propulsion Technology Panel has focused its energies. POPs can also travel in rivers from southeast and central Asia into the Pacific Ocean, where water currents flow into the Arctic Ocean.

Air pollution environmental issues

Abstract Airborne pollutants, especially sulfate and nitrate, have been known to cause acid rain problems. Manufacture and use for chemical intermediate as allowed under the Convention.
