By the end of the course, students will be able to identify crucial moral and epistemic issues in contemporary technology and choose between solutions to these difficult problems. Since its beginning, cognitive science has drawn upon formal developments in philosophy, logic, mathematics,

and computer science in order to establish various frameworks for generating and testing theories of cognition. Is matter a distributed field or localized into particles? We will then use the tools to discuss the ways in which deductive and inductive inference patterns are used in scientific reasoning.

For example, fields such as social science, economics, archaeology and even psychology fall somewhere in-between science and non - science. We will establish and follow community norms for discussing these topics, many of which may be sensitive or deeply personal. In a field filled with such vexing questions, the ethical issue most commonly addressed by the media is whether a self-driving car should swerve to hit one person to avoid hitting two.

Controversies provide valuable opportunities to examine how communities of scientist reason about theories, evidence, experiments, methodologies, and wider social implications of their work. Some questions we will consider include: do emotions inform us about the world, and if so, how? Where does the concept of race come from? It is tempting to see the past through the categories of the present. However, we will go beyond bioethics in exploring the ethical problems concerning the good , metaphysical problems concerning reality and epistemic problems concerning knowledge raised by bioethical dilemmas, including: rationality and reasoning, medicalization, the nature of pregnancy, the phenomenology of illness, the nature and badness of death, and the methodology of clinical research.
