By observing the order of superposition, and by tracing the divisionary limestones, he reads off the order of the strata, and chronicles with precision the succession of their respective fossils. The peat was twenty-two feet deep, and I pointed out to the engineer the difficulty of sufficiently bracing the piles, their tops being only about three feet above the soft bog. On the outermost western slopes of the Malvern Hills, and on the sides and summits of their northern prolongation the Abberley Hills, the Aymestry rock, though containing less calcareous matter than near Ludlow, is still the well-defined central portion of the forma- tion.
