Coal mine combustion products, identification and analysis. Final report, 8 July 1971

The studies indicate that styrene-butadiene based belts exhibit good flame resistance and are the least hazardous in regard to overall toxic decomposition product formation. However, because of the possible danger involved with the formation of toxic gases, the authors studied the decomposition of various materials.

Coal mine combustion products: identification and analysis (Technical Report)

During the current program four groups of materials were investigated. Extent 3 unnumbered pages, 15 pages Media category unmediated Media MARC source rdamedia Media type code n Label Coal mine combustion products : ingredients of conveyor belts, by Theodore Christos, David R.

Coal mine combustion products: identification and analysis. by Arthur M. Hartstein and David R. Forshey

For parts intended to move in contact with each other in vacuum, lubrication is a serious problem. In addition to these investigations, degradation studies were conducted on some pure ingredients used in conveyor-belt formulations.
