Geology and Production History of the Hume Frobisher Beds Oil Pool: And the ...

This is true both for the province as a whole and for the differing zones within it. These lithofacies represent a range of subtidal to supratidal settings and are interpreted to be related to four transgressive-regressive parasequences S1 to S4, in ascending order. These characteristics facilitate development of large horizontal underground excavation patterns, but are also favorable for horizontal well arrays for solution mining.

Geology and Production History of the Hume Frobisher Beds Oil Pool: And the ...

In a similar way, the most recent era is expanded in the third timeline, the most recent period is expanded in the fourth timeline, and the most recent epoch is expanded in the fifth timeline.

КНИГИ:

Communication between potash beds and overlying Cretaceous aquifers have resulted in brine seepage events into underground workings. Solution mining is used at three sites where the ore is buried to 1500 m depth or where this methodology was a necessary remedial action responding to flooding of an underground dry mine.

Horizontal Wells In The Rosebank Alida Beds Pool, Saskatchewan

Nimegeers; Lithofacies and depositional history of Midale carbonate-evaporite cycles in a Mississippian ramp setting, Steelman-Bienfait area, southeastern Saskatchewan, Canada. Edmonton, AB, CA: Hurtig Publishers Ltd. The carbonate-hosted oil pool at a depth of 1,070 m was discovered in 1955 and had produced 4.
